ASSIGNMENT PROJECT SYNOPSIS

COURSE NAME: PYTHON APPLICATION PROGRAMMING

COURSE CODE: 17CS664

TOPIC: SUSPENSION DETECTION AND REPORTING BOT

UNDER THE GUIDANCE OF:

Dr NAVEEN NC

Prepared by: -

HARSHITH R SHEKAR[1JS17CS039]

DHRUVA V [1JS18CS403]

BINDUSHREE R [1JS17CS025]

Marks Scored:

Semester / Branch: 6th 'A' sec

Signature of the Staff:

OVERVIEW

The ATM System is the project which is used to access their bank accounts to make cash withdrawals and deposits. Whenever the user needs to make cash withdraws, they can enter their PIN number (personal identification number) and it will display the amount to be withdrawn and deposit. Once their withdrawn was successful, the amount will be debited in their account and if deposit is complete, amount will be credited to the account.

The ATM System is developed in Python and a CSV file (Comma-separated values) using file read write. Python is relatively simple, so it is easy to learn since it requires a unique syntax that focuses on readability. Developers can read and translate Python code much easier than other languages. In turn, this reduces the cost of program maintenance and development because it allows teams to work collaboratively without significant language and experience barriers. Hence, we use this software in our project.

The ATM will service one customer at a time. A customer will be required to enter ATM Card number, personal identification number (PIN) – both of which will be sent to the database for validation as part of each transaction. The customer will then be able to perform one or more transactions. Also, customer must be able to make a balance inquiry of any account linked to the card.

If a transaction fails for any reason other than an invalid PIN, the ATM will display an explanation of the problem, and will then ask the customer whether he/she wants to do another transaction.

Millions of times per day around the globe people are instantly withdrawing money at automatic teller machines (ATMs). Given the fast pace of the world today, it is not surprising that the demand for access to quick cash is so immense. The power of ATMs would not be possible without secure connections. The final act of ATM dispensing cash is the result of an amazingly fast burst of the customer never sees, but a trust is being done in a confidential manner.

BACKGROUND WORK

PYTHON LIBRARIES

Since some print statements can be parsed as function calls or statements, python 2 to python 3 cannot always read files containing the print function. When 2 to 3 detects the presence of the `from __future__ import print_function` compiler directive, it modifies its internal grammar to interpret `print()` as a function. This change can also be enabled manually with the `-p` flag. Use `-p` to run fixers on code that already has had its print statements converted.

`os` module provides a portable way of using operating system dependent functionality. If you just want to read or write a file see `open()`, if you want to manipulate paths, see the `os.path` module, and if you want to read all the lines in all the files on the command line see the `fileinput` module. For creating temporary files and directories see the `tempfile` module, and for high-level file and directory handling see the `shutil` module.

`sys` module provides access to some variables used or maintained by the interpreter and to functions that interact strongly with the interpreter. It is always available.

The `smtplib` module defines an SMTP client session object that can be used to send mail to any Internet machine with an SMTP or ESMTP listener daemon. For details of SMTP and ESMTP operation, consult RFC 821 (Simple Mail Transfer Protocol) and RFC 1869 (SMTP Service Extensions).

`Time` module provides various time-related functions

The `datetime` module supplies classes for manipulating dates and times.

The so-called `CSV` (Comma Separated Values) format is the most common import and export format for spreadsheets and databases. CSV format was used for many years prior to attempts to describe the format in a standardized way in RFC 4180. The lack of a well-defined standard means that subtle differences often exist in the data produced and consumed by different applications. These differences can make it annoying to process CSV files from multiple sources. Still, while the delimiters and quoting characters vary, the overall format is similar enough that it is possible to write a single module which can efficiently manipulate such data, hiding the details of reading and writing the data from the programmer.

`re` module provides regular expression matching operations similar to those found in Perl.

`random` module implements pseudo-random number generators for various distributions.

The `getpass` module provides two functions:

- `getpass.getpass(prompt='Password: ', stream=None)`
- `getpass.getuser()`

ARCHITECTURE

ATM Functionalities(Using Basic Concepts of Python):

1. Account Handling
2. Activation\De-Activation of Accounts
3. Admin Control
4. File Handling (using csv file)
5. Account Number Auto-Generation
6. Pin Auto-Generation
7. Simple Encryption\Decryption
8. Date and Time Implication
9. Exceptional Handling
10. Email Notifier Using SMTP Library
11. Amount Transfer
12. Made Applicable for Any Version of Python

Then the functionalities are divided by different python files,

- **Python File** : acc_no_gen.py

Functionalities implemented Account Number Auto-Generation , Exceptional Handling and Made Applicable for Any Version of Python.

- **Python File** : ATM.py

Functionalities implemented Account Handling, Amount Transfer, Exceptional Handling and Made Applicable for Any Version of Python.

- **Python File** : Data.py

Functionalities implemented File Handling (using csv file), Exceptional Handling and Made Applicable for Any Version of Python.

- **Python File** : encrypt.py

Functionalities implemented Simple Encryption\Decryption.

- **Python File** : login.py

Functionalities implemented Admin Control, Pin Auto-Generation, Date and Time Implication, Exceptional Handling and Made Applicable for Any Version of Python.

- **Python File** : acc_no_gen.py

Functionalities implemented Email Notifier Using SMTP Library, Exceptional Handling and Made Applicable for Any Version of Python.

Implementation

- **Python File** : acc_no_gen.py

```
from random import randint, randrange
from Data import data

def account_no_gen(user_name):
    d = data()
    alphabets = 'abcdefghijklmnopqrstuvwxyz'
    acc_no = ""
    acc_no += str(len(d.keys()) + 10)
    for alpha in user_name:
        if (len(acc_no) < 12):
            if alpha in alphabets:
                index = alphabets.rfind(alpha)
                acc_no += str(index + 1)

            else:
                acc_no += '0'

        else:
            break

    if len(acc_no) > 12:
        final_acc_no = ""
        for index in acc_no:
            if len(final_acc_no) < 12:
                final_acc_no += index

        acc_no = final_acc_no
        return acc_no

    if len(acc_no) < 12:
        remain_index = 12 - len(acc_no)
        for index in range(remain_index):
            acc_no += str(randint(0,9))

        return acc_no

    else:
        return acc_no

def code():
    a = 'qwertyuiopasdfghjklzxcvbnm'
    conf_code = ""
    for i in range(3):
```

```

    conf_code += str(a[randrange(9)])+str(randrange(9))
return conf_code

```

- **Python File : ATM.py**

```

AREA OF FOCUS / OPTIMIZATIONS

- Check the number of users.
- Check the active accounts name.
- Check the accounts information.
- Check the accounts activity.
- Search accounts
- De-Activate account.

RESULTS / CONCLUSION

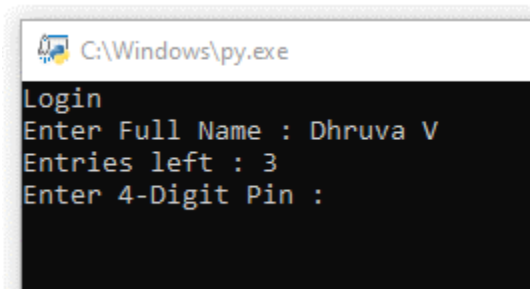

- **Login Menu**

```

C:\Windows\py.exe
Select One :
1. Login
2. Create New Account
3. Activate Account
4. De-Activate Account
0. Exit
  
```

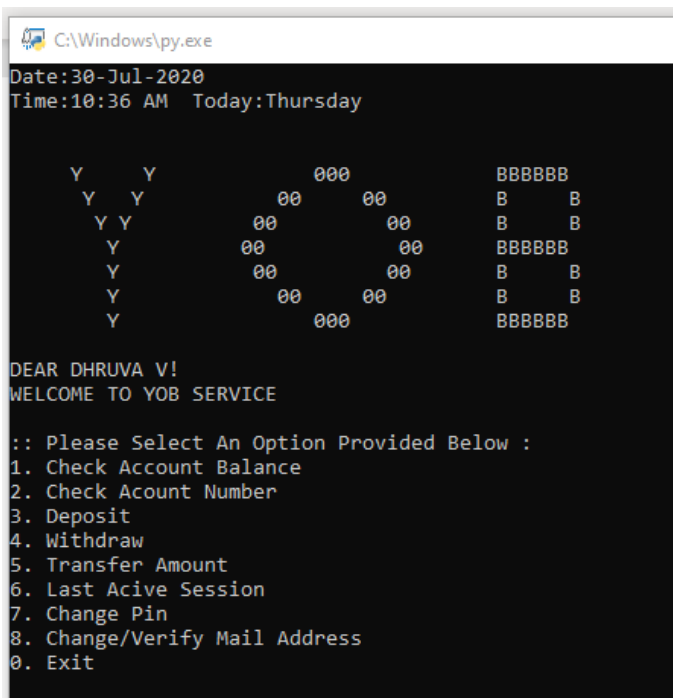

- **Login Enter Username & Pin**

```

C:\Windows\py.exe
Login
Enter Full Name : Dhruva V
Entries left : 3
Enter 4-Digit Pin :
  
```

- **ATM Home Page**

```

Since basic functions of ATM using python was the main objective of the project, we quantified the results of the project in terms of its functionalities implementation. The specifications of the computer used are as follows:

- Intel Core i3 or greater processor
- 4GB of RAM
- Monitor
- Python 2 or Python 3 version
- Visual Studio Code latest version
- Keyboard
- Mouse
